

Resources to Reduce Adverse Drug Events in Rural Hospitals

Michelle Casey, MS

Emma Distel, MPH

Shailendra Prasad, MBBS, MPH

Peiyin Hung, MSPH

Introduction

Adverse drug events (ADEs) are defined as events involving patient injury resulting from medication use; some ADEs are side effects that may occur even when a medication is taken correctly, while others are medication errors that occur when a medication is incorrectly prescribed or administered.¹ ADEs result in significant patient morbidity, increase lengths of stay in the hospital, and are costly.²⁻⁵

Purpose

This policy brief describes resources that could be used to decrease ADEs in rural hospitals. A [previous policy brief, “Identifying Adverse Drug Events in Rural Hospitals,”](#) found that ADE rates for the most common categories of medications involved in ADEs that occur during inpatient hospitalizations varied across CAHs, rural PPS, and urban PPS hospitals.

Approach

We reviewed the peer-reviewed literature to identify evidence-based strategies that have been successfully used to decrease ADEs in hospitals and searched the websites of organizations that have been actively involved in hospital quality improvement and medication safety initiatives, including the Institute for Healthcare Improvement, the Joint Commission, the Centers for Disease Control and Prevention, and the National Quality Forum. In selecting resources to feature in this policy brief, we focused on those that would be applicable to rural hospitals, including CAHs, and that are publicly available. The selected resources have already been successfully implemented in rural hospitals and/or were determined to be applicable to rural hospitals based on the clinical judgment of a physician with extensive rural hospital experience who was a member of the research team.

Resources to Decrease ADEs in Rural Hospitals

Training providers (physicians, nurses, and staff) to be aware of the potential risks of using certain medications as well as the signs of an ADE is recommended in all hospital and clinic settings. Various strategies and tools have been developed and implemented to identify and decrease ADEs in hospitals. These include overall resources to identify and prevent ADEs (Table 1) as well as resources to prevent ADEs resulting from use of specific medications, including anticoagulants (Table 2), narcotics and opiates (Table 3), and antibiotics (Table 4).

Table 1. Overall resources for preventing ADEs

<p>Institute for Healthcare Improvement</p>	<p>IHI Trigger Tool for Measuring Adverse Drug Events^a http://www.ihl.org/resources/pages/tools/triggertoolformeasuringadversedrugevents.aspx</p> <p>Triggers can be used to identify adverse drug events. This tool includes:</p> <ul style="list-style-type: none"> • A list of medications or orders that are triggers, or clues that an adverse drug event occurred. • An overview of the process to create a sampling plan to identify adverse drug events using patient medical records and case studies.
<p>Institute for Healthcare Improvement</p>	<p>How-to Guide: Prevent Harm from High-Alert Medications^a http://www.ihl.org/resources/Pages/Tools/HowtoGuidePreventHarmfromHighAlertMedications.aspx</p> <p>This guide outlines steps in developing a team specific to improvement including a physician, nurse, and pharmacist among other staff. It highlights key principles for prevention of adverse drug events:</p> <ul style="list-style-type: none"> • Develop pathways or protocols to establish a standardized approach to treating patients with similar needs. • Adopt TALL-man lettering for pharmacy-produced labels to differentiate drug names with potential for mix-up. • Standardize concentrations and dose strengths to the minimum needed for safe care. • Include reminders and information about appropriate monitoring parameters in the order sets, protocols, and flow sheets. • Centralized pharmacist- or nurse-run services for specific groups of medications • Consider protocols for vulnerable populations

Table 2. Resources for preventing ADEs involving anticoagulants

<p>Purdue University PharmaTAP (in collaboration with the Indiana Patient Safety Center, Indiana Hospital Association, and VHA Central)</p>	<p>Anticoagulant Toolkit: Reducing Adverse Drug Events http://www.ihl.org/resources/pages/tools/anticoagulanttoolkitreducingades.aspx</p> <p>This toolkit provides a number of strategies to reduce anticoagulant-related ADEs in the inpatient, outpatient, and transitional care setting. Practices include:</p> <ul style="list-style-type: none"> • Using protocols, checklists, guidelines, and reminders • Create a process that uses redundancy, checklists and double checks throughout the process • Improve access to patient and medication information • Simplify the number of tasks per staff member, reduce the amount of staff involved and manage staff fatigue • Provide staff with accurate training and resources.
<p>Institute for Healthcare Improvement</p>	<p>Reduce Adverse Drug Events Involving Anticoagulants^a http://www.ihl.org/resources/Pages/Changes/ReduceAdverseDrugEventsInvolvingAnticoagulants.aspx</p> <p>This website includes resources designed to make changes for improvement in how anticoagulants are used including:</p> <ul style="list-style-type: none"> • Guidelines, flowsheets, and protocols for specific orders and dosing recommendations/regimens • Pharmacist-managed anticoagulation tips
<p>Joint Commission</p>	<p>Preventing Errors Relating to Commonly-Used Anticoagulants https://www.jointcommission.org/sentinel_event_alert_issue_41_preventing_errors_relating_to_commonly_used_anticoagulants/</p> <p>This JC Sentinel Event Alert highlights the importance of:</p> <ul style="list-style-type: none"> • Use of evidence-based practices or best practices • Conducting an organization-wide risk assessment for possible anticoagulant therapy ADEs, • Setting dose limits • Labeling and differentiating between different types of medications • Evaluating anticoagulant dosing and communicate between providers • Patient education and practice administering medication
